## ABSTRACT

Sulphur dioxide gas (SO<sub>2</sub>) is derived from the combustion of fuels containing sulphur. Aside from fuel, sulphur is also contained in the lubricant. Sulphur dioxide gas is difficult to detect because it is colourless gas. Sulphur dioxide can cause respiratory disorders, indigestion, headache, chest pain, and nerve. A necessary preventive measures to reduce the impact of air pollutants SO<sub>2</sub> particular elements, one of them by making the modeling that can bring the causes and factors resistor element of air pollutants SO<sub>2</sub>. The modeling is Geographically Weighted Regression (GWR), Temporal Geographically Weighted Regression (GTWR) and Mixed Geographically Weighted Temporal Regression (MGTWR). All three models are regression models spatial, temporal and spatial temporal spatial- combined, which models the effects of air pollutants SO<sub>2</sub> element with a direct view of geography and time of occurrence of air pollution. The third model is then compared to obtain the best model in the modeling of air pollutants SO<sub>2</sub> elements.

**Keywords:** air polluter, sulphur dioxide, GWR, GTWR, MGTWR.

## 1. INTRODUCTION

Patients with diseases caused by air pollution with increased industrialization and urbanization in developing countries showed a parallel relationship [1]. Gas Sulphur dioxide (SO<sub>2</sub>) is one elements of air pollutants generated from the combustion of lubricant and incomplete combustion from motor vehicles and industrial machinery. Fumes are a major source for sulphur dioxide (SO<sub>2</sub>) in various cities. There is 60 percent of air pollution in large cities contributed by public transport [2]. Sulphur dioxide is a poison that causes shortness of breath, nervous disorders. At levels above the threshold limit, can cause death. Victims of sulphur dioxide are not only humans, but also buildings and plants. The existence of this gas in the air can cause acid rain which damaged building materials and impede growth plants. Standard quality that is allowed is ≤365 mg / Nm<sup>3</sup> [3]. An appropriate model for this case is to look at the elements of the location (geography), because of the potential impact and cause air pollution will vary between locations [4-5]. Regression model by looking at the spatial element is *Geographically Weighted Regression* (GWR). GWR is a statistical method used to analyse Spatial *heterogeneity* referred to is a state measurement of the relationship (*Measurement of relationship*) Between variables vary from one location to another location [6]. Spatial heterogeneity occurs when the same independent variables are not the same response in different locations within the study area [7]. Namely the Model GWR regression model to the point that differs from the other dots [8]. Besides GWR, spatial regression model that also involves the element of time is Temporal Geographically Weighted Regression (GTWR) as well as the model mix of GWR, GTWR and OLS regression. Mixed Geographically Temporal Weighted Regression

(MGTWR) is a global regression modeling combined with local regression (GWR) [9]. Later in this paper a compare of the three models, namely GWR, GTWR and MGWTR to see the best model.

## 2. RESEARCH OBJECTIVE

This study aims to model air pollutant elements of SO<sub>2</sub> with GWR approach, GTWR and MGTWR and comparing them.

## 3. METODOLOGY

### 3.1 Geographically weighted regression (GWR)

Geographically Weighted Regression (GWR) is the development of a regression model where each parameter is calculated at each observation location, so that each location has a value parameter regression observation Different. GWR model can be written as follows [6-7]:

$$y_i = \beta_0(u_i, v_i) + \sum_{k=1}^p \beta_k(u_i, v_i) x_{ik} + \varepsilon_i \quad (1)$$

Where

$(u_i, v_i)$  = Stating geographical location coordinates (*Longitude, latitude*) From the location of the observation – *i*

$\beta_k(u_i, v_i)$  = The regression coefficient predictor variables –*k* and location of the observation –*i*

### 3.2 Geographically temporal weighted regression (GTWR)

GTWR not only accommodate the spatial heterogeneity, but also pay attention to heterogenitas temporally [10]. STWR for variable predictor of the dependent variables  $y_i$  coordinate  $\{(u_i, v_i, t_i)\}$  for each observation is as follows:

$$y_i = \beta_0(u_i, v_i, t_i) + \sum_{k=1}^p \beta_k(u_i, v_i, t_i)x_{ik} + \varepsilon_i \quad (2)$$

Where

$i = 1, 2, 3, \dots, n$

$u_i$  = longitude at the time- $i$

$v_i$  = latitude at the time- $i$

$t_i$  = time length at the time- $i$

### 3.3 Mixed geographically temporal weighted regression (MGTWR)

MGTWR is the development of a model MGWR [11], with the added element of time that is temporal. Temporal factors developed is intended to predict the observed time serves to complement the location factors (location coordinates). Mathematically, temporal models that can be expressed as follows:

$$y_i = \sum_{j=1}^q \beta_j x_{ij} + \beta_j(u_i, v_i, t_i)x_{ij} + \varepsilon_i \quad (3)$$

Where:  $i = 1, 2, 3, \dots, n$

$u_i$  = longitude at the time- $i$

$v_i$  = latitude at the time- $i$

$t_i$  = time length at the time- $i$

In the case study of this research used the response variable  $Y$  is an element of Sulphur Dioxide ( $SO_2$ ) and predictor variables, the water temperature ( $X_1$ ), the wind velocity ( $X_2$ ), the air humidity ( $X_3$ ), the traffic velocity ( $X_4$ ), the area size of the urban forest ( $X_5$ ), the population density ( $X_6$ ), the business center aspect ( $X_7$ ) [12].

## 4. RESULTS AND DISCUSSIONS

### 4.1 Statistical test model GWR, GTWR and MGTWR

Test Model GWR, GTWR and MGTWR the first is testing the suitability of the model.

1. The first GWR model test is the model fitness, in which the hypothesis can be stated as the followings:

$$H_0 : \beta_k(u_i, v_i, t_i) = \beta_k \quad k=0,1,2,\dots,4, \text{ dan } i=1,2,\dots,5$$

(GWR model is no different from the global Regression)

$$H_1 : \text{At least one } \beta_k(u_i, v_i, t_i) \neq \beta_k$$

(GWR model is significantly different from the global Regression Model)

The test results are summarized in Table 1:

**Table-1.** Fitness test of GWR model for the  $SO_2$  Response.

| Source Error | Sum Square | Degree of Freedom | Mean Square | F     | p-value |
|--------------|------------|-------------------|-------------|-------|---------|
| Improvement  | 14.235     | 78.991            | 0,1789      | 6,264 | 0,0093  |
| GWR          | 56,1587    | 4.103.512         | 0,1369      |       |         |
| Regression   | 57,5722    | 4.100.000         |             |       |         |

Table-1 indicates that the value of the F test statistic of 6.2641 with a p-value of 0.0093. Out by using a level of significance ( $\alpha$ ) 5% then Reject  $H_0$  and concluded that differ significantly from the GWR models Global regression, so the model is more feasible GWR to describe the data modeling elements  $SO_2$ . Very influential in the location element modeling elements  $SO_2$ .

GWR statistical summary of the parameters are as follows:

**Table-2.** Summary statistics local parameter GWR model with weighted Exponential.

| Parameter Statistics Summary GWR |         |         |         |        |        |
|----------------------------------|---------|---------|---------|--------|--------|
| Variable                         | Min     | Max     | Mean    | Range  | StdV   |
| $B_0$                            | 45.331  | 45.526  | 45.404  | 0.0195 | 0.0073 |
| $B_1$                            | 0.0202  | 0.0246  | 0.0218  | 0.0044 | 0.0016 |
| $B_2$                            | -0.0568 | -0.0373 | -0.0460 | 0.0194 | 0.0066 |
| $B_3$                            | 0.0099  | 0.0178  | 0.0144  | 0.0079 | 0.0029 |
| $B_4$                            | 0.1365  | 0.1475  | 0.1415  | 0.0110 | 0.0042 |
| $B_5$                            | 0.0845  | 0.1001  | 0.0933  | 0.0157 | 0.0060 |
| $B_6$                            | -0.1218 | -0.0907 | -0.1061 | 0.0310 | 0.0106 |
| $B_7$                            | 0.0614  | 0.0753  | 0.0687  | 0.0140 | 0.0054 |

To see where the predictor variables that influence different at each location of the observation, it can be used to test the partial influence of geographical factors for each predictor variable. Table-3 shows that using a significance level ( $\alpha$ ) 5% it can be concluded that the variables Influence locally, the wind velocity ( $X_2$ ), the traffic velocity ( $X_4$ ), the area size of the urban forest ( $X_5$ ), the population density ( $X_6$ ), the business center aspect ( $X_7$ ).

**Table-3.** Test of influence of geographic factors predictors of GWR with weighting variables Exponential

| Variable | F       | P-Value |
|----------|---------|---------|
| Constant | 238.094 | 0.0000* |
| $Z_1$    | 0.1311  | 0.8641  |
| $Z_2$    | 53.318  | 0.0094* |
| $Z_3$    | 0.4647  | 0.6149  |
| $Z_4$    | 31.722  | 0.0467* |
| $Z_5$    | 229.289 | 0.0000* |
| $Z_6$    | 173.740 | 0.0000* |
| $Z_7$    | 186.414 | 0.0000* |

Note: \*) significant at  $\alpha = 5\%$

2. The fitness Test of GTWR model, in which the hypothesis can be stated as the followings:

- $H_0$  :  $\beta_k(u_i, v_i, t_i) = \beta_k$   $k=0,1,2,\dots,4$ , dan  $i=1,2,\dots,5$   
 (GTWR model is not different from the global regression model)
- $H_1$  : At Least One  $\beta_k(u_i, v_i, t_i) \neq \beta_k$  (GTWR model is significantly different from the global regression model)

The test results are summarized in Table-4:

**Table-4.** Fitness Test of GTWR Model for the SO<sub>2</sub> Response.

| Source of Error | Sum Square | Degree of Freedom | Mean Square | F     | p-value |
|-----------------|------------|-------------------|-------------|-------|---------|
| Improvement     | 113.219    | 249.389           | 0,454       | 4,667 | 0,0001  |
| GTWR            | 46,2503    | 3.914.643         | 0,1181      |       |         |
| Regression      | 57,5722    | 4.120.000         |             |       |         |

Table-4 shows that the F test statistical value is 4,6665, and the p-value of 0,000. Using the significance value( $\alpha$ )of 5%, we must reject  $H_0$ , and conclude that the GTWR model is significantly different from the Global Regression model. Therefore, we can further conclude that the GTWR model is more proper to model the Air Polluter Standard Index (APSI) for SO<sub>2</sub>. This means that the time element is influential in the APSI modeling for SO<sub>2</sub> so that not only the location factor is considered, but the observation time is taken as the influential factor to the APSI model for SO<sub>2</sub> as well.

GTWR statistical summary of the parameters are as follows:

**Table-5.** Summary statistics local parameter model GTWR with weighted exponential.

| Parameter Statistics Summary GTWR |         |         |         |        |        |
|-----------------------------------|---------|---------|---------|--------|--------|
| Variable                          | Min     | Max     | Mean    | Range  | StDv   |
| B <sub>0</sub>                    | 43.949  | 44.958  | 44.505  | 0.1010 | 0.0400 |
| B <sub>1</sub>                    | -0.0065 | 0.0629  | 0.0220  | 0.0695 | 0.0263 |
| B <sub>2</sub>                    | -0.0950 | 0.0312  | -0.0491 | 0.1262 | 0.0496 |
| B <sub>3</sub>                    | -0.0545 | 0.2128  | 0.0487  | 0.2672 | 0.1058 |
| B <sub>4</sub>                    | -0.0294 | 0.2330  | 0.1388  | 0.2624 | 0.1141 |
| B <sub>5</sub>                    | 0.0579  | 0.1362  | 0.0927  | 0.0783 | 0.0276 |
| B <sub>6</sub>                    | -0.1383 | -0.0271 | -0.0850 | 0.1111 | 0.0359 |
| B <sub>7</sub>                    | 0.0294  | 0.0607  | 0.0464  | 0.0313 | 0.0088 |

To see where the predictor variables that influence different at each location of the observation, it can be used to test the partial influence of geographical factors for each predictor variable. Table 6 shows that the level of significance ( $\alpha$ ) 5% it can be concluded that the variables that influence local, the traffic velocity (X<sub>4</sub>).

**Table-6.** Test variables influent geographic factor predictor GTWR with weighted exponential.

| Variable       | F       | P-Value |
|----------------|---------|---------|
| Constant       | 0.2984  | 0.7185  |
| Z <sub>1</sub> | 0.1007  | 0.8984  |
| Z <sub>2</sub> | 19.120  | 0.1494  |
| Z <sub>3</sub> | 44.467  | 0.0127  |
| Z <sub>4</sub> | 204.349 | 0.0000* |
| Z <sub>5</sub> | 10.869  | 0.3389  |
| Z <sub>6</sub> | 0.9692  | 0.3812  |
| Z <sub>7</sub> | 0.0702  | 0.9324  |

Note: \*) significant at  $\alpha = 5\%$

3. The fitness Test of MGTWR Model, in which the hypothesis can be stated as the followings:

- $H_0$  :  $\beta_k(u_i, v_i, t_i) = \beta_k(u_i, v_i)$   $k=0,1,2,\dots,4$ , dan  $i=1,2,\dots,5$   
 (MGTWR model is not different from the MGWR model)
- $H_1$  : At Least One  $\beta_k(u_i, v_i, t_i) \neq \beta_k(u_i, v_i)$   
 (MGTWR model is significantly different from the MGWR)

The test results are summarized in Table-7:

**Table-7.** Fitness test of MGTWR model for the SO<sub>2</sub> response.

| Source of Error | Sum Square | Degree of Freedom | Mean Square | F      | p-value |
|-----------------|------------|-------------------|-------------|--------|---------|
| Improvement     | 86.937     | 98.418            | 0,8833      | 9,2852 | 0,0000  |
| MGTWR           | 481.719    | 4.055.713         | 0,1188      |        |         |
| MGWR            | 568.656    | 4.118.569         |             |        |         |

Table-7 shows that the F test statistical value is 9,2852, and the p-value of 0,000. Using the significance value ( $\alpha$ ) of 5%, we must reject  $H_0$ , and conclude that the MGTWR model is significantly different from the MGWR. Therefore, we can further conclude that the MGTWR model is more proper to model the Air Polluter Standard Index (APSI) for SO<sub>2</sub>. This means that the time element is influential in the APSI modeling for SO<sub>2</sub> so that not only the location factor is considered, but the observation time is taken as the influential factor to the APSI model for SO<sub>2</sub> as well.

MGTWR statistical summary of the parameters are as follows:

**Table-8.** Summary statistics local parameter model MGTWR with weighted exponential.

| Parameter Statistics Summary MTGWR |         |        |        |        |        |
|------------------------------------|---------|--------|--------|--------|--------|
| Variable                           | Min     | Max    | Mean   | Range  | StDv   |
| B <sub>1</sub>                     | 44.552  | 44.910 | 44.804 | 0.0358 | 0.0121 |
| B <sub>3</sub>                     | -0.0709 | 0.2317 | 0.0534 | 0.3026 | 0.1170 |
| B <sub>4</sub>                     | -0.0293 | 0.2389 | 0.1386 | 0.2682 | 0.137  |

#### 4.2 Comparison model GWR, GTWR and MGTWR

The next grouping of observation location by using three models, GWR, GTWR and MGTWR

**Table-9.** GWRmodel for SO<sub>2</sub> at five observation location nodes.

| No. | Observation Location | Significant variables |
|-----|----------------------|-----------------------|
| 1   | SUF 1                | X4, X5, X6 and X7     |
| 2   | SUF 3                | X2, X4, X5, X6 and X7 |
| 3   | SUF 4                | X2, X4, X5, X6 and X7 |
| 4   | SUF 5                | X2, X4, X5, X6 and X7 |
| 5   | SUF 6                | X2, X4, X5, X6 and X7 |

**Table-10.** GTWRmodel for SO<sub>2</sub> at five observation location nodes.

| No. | Observation Location | Observation Time | Significant variables |
|-----|----------------------|------------------|-----------------------|
| 1   | SUF 1                | Morning          | X3, X5 and X6         |
|     |                      | Noon             | X4 dan X5             |
|     |                      | Evening          | X2, X4, X5 and X6     |
| 2   | SUF 3                | Morning          | X3, X5, and X6        |
|     |                      | Noon             | X4 dan X5             |
|     |                      | Evening          | X2, X4, X5 and X6     |
| 3   | SUF 4                | Morning          | X3, X5 and X6         |
|     |                      | Noon             | X4 dan X5             |
|     |                      | Evening          | X2, X4, X5 and X6     |
| 4   | SUF 5                | Morning          | X3, X5 and X6         |
|     |                      | Noon             | X4 dan X5             |
|     |                      | Evening          | X2, X4, X5 and X6     |
| 5   | SUF 6                | Morning          | X3, X5 and X6         |
|     |                      | Noon             | X4 dan X5             |
|     |                      | Evening          | X2, X4, X5 and X6     |

**Table-11.** MGTWRmodel for SO<sub>2</sub> at five observation location nodes.

| No | Observation Location | Observation Time | Local Significant Variables       | Global Significant Variables  |
|----|----------------------|------------------|-----------------------------------|---|
| 1  | SUF 1                | Morning          | X <sub>3</sub>                    | X <sub>2</sub> , X <sub>5</sub> , X <sub>6</sub> dan X <sub>7</sub> |
|    |                      | Noon             | X <sub>4</sub>                    |   |
|    |                      | Evening          | X <sub>4</sub>                    |   |
| 2  | SUF 3                | Morning          | X <sub>3</sub>                    |   |

|    |                      | Evening          | X <sub>4</sub>                    |   |
| 3  | SUF 4                | Morning          | X <sub>3</sub>                    |   |
|    |                      | Noon             | X <sub>3</sub> dan X <sub>4</sub> |   |
|    |                      | Evening          | X <sub>4</sub>                    |   |
| 4  | SUF 5                | Morning          | X <sub>3</sub>                    |   |
|    |                      | Noon             | X <sub>3</sub> dan X <sub>4</sub> |   |
|    |                      | Evening          | X <sub>4</sub>                    |   |
| 5  | SUF 6                | Morning          | X <sub>3</sub>                    |   |
|    |                      | Noon             | X <sub>3</sub> dan X <sub>4</sub> |   |
|    |                      | Evening          | X <sub>4</sub>                    |   |

To see which models are most appropriate to describe the pollutant, then used R<sup>2</sup>, AIC and MSE, as shown in Table-12 below:

**Table-12.** Comparison of estimated GWR, GTWR and MGTWR.

| Analysis       | GWR         | GTWR        | MGTWR       |
|----------------|-------------|-------------|-------------|
| Weighted       | Exponential | Exponential | Exponential |
| R <sup>2</sup> | 0.7157      | 0.7541      | 0.8273      |
| MSE            | 0.1369      | 0.1181      | 0.1104      |
| AIC            | 367.122     | 324.1381    | 271.6596    |

Criteria for the good of the model used are to compare the value of Mean Square Error (MSE), the coefficient of determination (R<sup>2</sup>), Akaika Information Criterion (AIC) of the MGTWR models. The smallest MSE, R<sup>2</sup> largest and smallest AIC. Shown in Table-12 that the most appropriate model to describe the air pollutant is MGTWR model.

## 5. CONCLUSIONS

Comparison of estimates of air pollutant models most suitable is MGTWR, which is influenced by factors location (geographically) showed a significant effect as well as a global influence. So the model *Mixed* is suitable for modeling of air pollutants in this study. The influence of local models MGTWR elements of SO<sub>2</sub> for observation time morning and afternoon shows two predictor variables that influence that the air humidity (X<sub>3</sub>), the traffic velocity (X<sub>4</sub>), it indicates that in the morning and during the day the effects of smoke from the burning vehicle motor and the humidity is very dominant influence of air pollution SO<sub>2</sub> elements. for night time observation almost all predictor variables affect air pollution. whereas the global influence is the wind velocity (X<sub>2</sub>), the area size of the urban forest (X<sub>5</sub>), the population density (X<sub>6</sub>), the business center aspect (X<sub>7</sub>).
